

**Section 6.14 #6**Calculate  $A^n$  and express  $A^3$  in terms of  $I$ ,  $A$ , and  $A^2$ 

Used Corollary 6.14 (page 210)

$$A = \begin{bmatrix} 0 & 1 & 1 \\ 0 & 1 & 1 \\ 0 & 0 & 0 \end{bmatrix}$$

$$f(\lambda) = \det(\lambda I - A)$$

$$A^3 = AA^2$$

$$\lambda I - A = \begin{bmatrix} \lambda & 0 & 0 \\ 0 & \lambda & 0 \\ 0 & 0 & \lambda \end{bmatrix} - \begin{bmatrix} 0 & 1 & 1 \\ 0 & 1 & 1 \\ 0 & 0 & 0 \end{bmatrix} = \begin{bmatrix} \lambda & -1 & -1 \\ 0 & (\lambda-1) & -1 \\ 0 & 0 & \lambda \end{bmatrix}$$

$$\begin{aligned} \det \begin{pmatrix} \lambda & -1 & -1 \\ 0 & (\lambda-1) & -1 \\ 0 & 0 & \lambda \end{pmatrix} &= a_{11}a_{22}a_{33} + a_{12}a_{23}a_{31} + a_{13}a_{21}a_{32} \\ &\quad - a_{12}a_{21}a_{33} - a_{11}a_{23}a_{32} - a_{13}a_{22}a_{31} \\ &= \lambda^2(\lambda-1) + (-1)^2 \cdot 0 + \lambda \cdot 0 \\ &\quad - (-1)\lambda \cdot 0 - \lambda(-1) \cdot 0 - (-1)(\lambda-1) \cdot 0 \\ &= \lambda^2(\lambda-1) = \lambda^3 - \lambda^2 + 0 \cdot \lambda + 0 \end{aligned}$$

$$c_0 = 1, c_1 = 0, c_2 = -1, c_3 = 1$$

$$A^3 = c_2 \cdot A^2 + c_1 \cdot A + c_0 \cdot I$$

$$A^3 = 1 \cdot A^2 + 0 \cdot A + 0 \cdot I$$

We know...

$$A \cdot A = \begin{bmatrix} 0 & 1 & 1 \\ 0 & 1 & 1 \\ 0 & 0 & 0 \end{bmatrix} = A^2 = A$$

If  $n$  is an even number then  $A^n = (A^2)^k$ 

$$A^n = A^2 \cdot A^2 \cdot A^2 \cdot A^2 \dots$$

$$A^n = A \cdot A \cdot A \cdot A \dots$$

$$A^n = A^2 \cdot A^2 \dots$$

$$A^n = A$$

If  $n$  is an odd number then  $A^n = (A^2)^k A$ 

$$A^n = A^2 \cdot A^2 \cdot A^2 \cdot A^2 \dots \cdot A$$

$$A^n = A \cdot A \cdot A \cdot A \dots \cdot A$$

$$A^n = A^2 \cdot A^2 \dots \cdot A$$

$$A^n = A \cdot A = A$$

If  $k$  is not a multiple of 2, then an extra  $A^2$  will be produced leaving.

$$A^n = A \cdot A^2$$

$$A^n = A \cdot A = A$$

So..

$$A^n = \begin{bmatrix} 0 & 1 & 1 \\ 0 & 1 & 1 \\ 0 & 0 & 0 \end{bmatrix} = A$$

### Section 7.4 #5

Let  $V = \mathbf{R}^3$  with all the usual dot product as inner product. Let  $T$  be a reflection in the  $xy$  plane; that is let  $T(i) = i$ ,  $T(j) = j$ ,  $T(k) = -k$ . Prove that  $T$  is symmetric.

If we can prove  $T$  is Hermitian, then it is symmetric. (by defn page 218)

$T$  is Hermitian if...

$$(T(x), y) = (x, T(y)) \text{ for all } x \text{ and } y \text{ in } V$$

Any element  $x$  and  $y$  in  $V$  can be written as a linear combination of  $i$ ,  $j$ , and  $k$

$$x = a*i + b*j + c*k$$

$$y = d*i + e*j + f*k$$

$$T(x) = T(a*i + b*j + c*k)$$

$$T(y) = T(d*i + e*j + f*k)$$

$$T(x) = aT(i) + bT(j) + cT(k)$$

$$T(y) = dT(i) + eT(j) + fT(k)$$

$$T(x) = a*i + b*j - c*k$$

$$T(y) = d*i + e*j - f*k$$

$$(T(x), y) = [a \ b \ -c] \cdot [d \ e \ f] = ad + be - cf$$

$$(x, T(y)) = [a \ b \ c] \cdot [d \ e \ -f] = ad + be - cf$$

$(T(x), y) = (x, T(y))$  so  $T$  is Hermitian and therefore symmetric!
