

Math 1553 Worksheet §5.6 - §6.5

Solutions

1. Courage Soda and Dexter Soda compete for a market of 210 customers who drink soda each day.

Today, Courage has 80 customers and Dexter has 130 customers. Each day:

70% of Courage Soda's customers keep drinking Courage Soda, while 30% switch to Dexter Soda.

40% of Dexter Soda's customers keep drinking Dexter Soda, while 60% switch to Courage Soda.

- a) Write a stochastic matrix A and a vector x so that Ax will give the number of customers for Courage Soda and Dexter Soda (in that order) tomorrow. You do not need to compute Ax .

$$A = \begin{pmatrix} 0.7 & 0.6 \\ 0.3 & 0.4 \end{pmatrix} \text{ and } x = \begin{pmatrix} 80 \\ 130 \end{pmatrix}.$$

- b) Find the steady-state vector for A .

$$(A - I \mid 0) = \left(\begin{array}{cc|c} -0.3 & 0.6 & 0 \\ 0.3 & -0.6 & 0 \end{array} \right) \xrightarrow[\substack{R_2 = R_2 + R_1 \\ R_1 = R_1 / (-0.3)}]{R_2 = R_2 + R_1} \left(\begin{array}{cc|c} 1 & -2 & 0 \\ 0 & 0 & 0 \end{array} \right)$$

so $x_1 = 2x_2$ and x_2 is free. A 1-eigenvector is $\begin{pmatrix} 2 \\ 1 \end{pmatrix}$, so the steady state vector

$$\text{is } w = \frac{1}{2+1} \begin{pmatrix} 2 \\ 1 \end{pmatrix} = \begin{pmatrix} 2/3 \\ 1/3 \end{pmatrix}.$$

- c) Use your answer from (b) to determine the following: in the long run, roughly how many daily customers will Courage Soda have?

As n gets large, $A^n \begin{pmatrix} 80 \\ 130 \end{pmatrix}$ approaches $210 \begin{pmatrix} 2/3 \\ 1/3 \end{pmatrix} = \begin{pmatrix} 140 \\ 70 \end{pmatrix}$. Courage will have roughly 140 customers.

2. True/False

- (1) If u is in subspace W , and u is also in W^\perp , then $u = 0$.
- (2) If y is in a subspace W , the orthogonal projection of y onto W^\perp is 0.
- (3) If x is orthogonal to v and w , then x is also orthogonal to $v - w$.

Solution.

- (1) TRUE: Such a vector u would be orthogonal to itself, so $u \cdot u = \|u\|^2 = 0$. Therefore, u has length 0, so $u = 0$.
- (2) TRUE: y is in W , so $y \perp W^\perp$. Its orthogonal projection onto W is y and orthogonal projection onto W^\perp is 0. In fact y has orthogonal decomposition $y = y + 0$, where y is in W and 0 is in W^\perp .

(3) TRUE: By properties of the dot product, if x is orthogonal to v and w then x is orthogonal to everything in $\text{Span}\{v, w\}$ (which includes $v - w$).

3. a) Find the standard matrix B for proj_L , where $L = \text{Span}\left\{\begin{pmatrix} 1 \\ 1 \\ -1 \end{pmatrix}\right\}$.
- b) What are the eigenvalues of B ? Is B diagonalizable?

Solution.

a) We use the formula $B = \frac{1}{u \cdot u} uu^T$ where $u = \begin{pmatrix} 1 \\ 1 \\ -1 \end{pmatrix}$ (this is the formula $B = A(A^T A)^{-1} A^T$ when “ A ” is just the single vector u).

$$B = \frac{1}{1(1) + 1(1) + (-1)(-1)} \begin{pmatrix} 1 \\ 1 \\ -1 \end{pmatrix} (1 \ 1 \ -1) = \frac{1}{3} \begin{pmatrix} 1 & 1 & -1 \\ 1 & 1 & -1 \\ -1 & -1 & 1 \end{pmatrix}$$

$$\implies B = \frac{1}{3} \begin{pmatrix} 1 & 1 & -1 \\ 1 & 1 & -1 \\ -1 & -1 & 1 \end{pmatrix}.$$

b) $Bx = x$ for every x in L , and $Bx = 0$ for every x in L^\perp , so B has two eigenvalues: $\lambda_1 = 1$ with algebraic and geometric multiplicity 1, $\lambda_2 = 0$ with algebraic and geometric multiplicity 2. Since the algebraic and geometric multiplicities are the same for each eigenvalue, we know B is diagonalizable. We can actually compute the diagonalization of B (we’re not asked in the question). Here $v_1 = \begin{pmatrix} 1 \\ 1 \\ -1 \end{pmatrix}$ is an eigenvector for $\lambda_1 = 1$, whereas $v_2 = \begin{pmatrix} 1 \\ -1 \\ 0 \end{pmatrix}$ and $v_3 = \begin{pmatrix} 1 \\ 0 \\ 1 \end{pmatrix}$ are eigenvectors for $\lambda_2 = 0$. Therefore

$$B = \begin{pmatrix} 1 & 1 & 1 \\ 1 & -1 & 0 \\ -1 & 0 & 1 \end{pmatrix} \begin{pmatrix} 1 & 0 & 0 \\ 0 & 0 & 0 \\ 0 & 0 & 0 \end{pmatrix} \begin{pmatrix} 1 & 1 & 1 \\ 1 & -1 & 0 \\ -1 & 0 & 1 \end{pmatrix}^{-1}$$

4. $y = \begin{pmatrix} 0 \\ 2 \\ 4 \end{pmatrix}$, $u_1 = \begin{pmatrix} 1 \\ 1 \\ 0 \end{pmatrix}$, $u_2 = \begin{pmatrix} -1 \\ 1 \\ 0 \end{pmatrix}$

- (1) Determine whether u_1 and u_2
 - (a) are linearly independent
 - (b) are orthogonal
 - (c) span \mathbf{R}^3
- (2) Is y in $W = \text{Span}\{u_1, u_2\}$?
- (3) Compute the vector w that most closely approximates y within W .
- (4) Construct a vector, z , that is in W^\perp .
- (5) Make a rough sketch of W , y , w , and z .

Solution.

- (1) A quick check shows that the vectors u_1 and u_2 are orthogonal and linearly independent, so $\text{Span}\{u_1, u_2\}$ is a plane in \mathbf{R}^3 , but is not all of \mathbf{R}^3 .
- (2) By inspection, y is not in the span because it has a non-zero x_3 component.
- (3) The vector w is $\text{proj}_W y$. The orthogonal projection of y onto W is calculated in the usual way.

$$A^T A = \begin{pmatrix} 2 & 0 \\ 0 & 2 \end{pmatrix}, \quad A^T b = \begin{pmatrix} 2 \\ 2 \end{pmatrix}, \quad \text{so} \quad \begin{pmatrix} 2 & 0 \\ 0 & 2 \end{pmatrix} v = \begin{pmatrix} 2 \\ 2 \end{pmatrix}, \quad v = \begin{pmatrix} 1 \\ 1 \end{pmatrix}$$

$$w = Av = \begin{pmatrix} 1 & -1 \\ 1 & 1 \\ 0 & 0 \end{pmatrix} \begin{pmatrix} 1 \\ 1 \end{pmatrix} = \begin{pmatrix} 0 \\ 2 \\ 0 \end{pmatrix}.$$

Another quick way to do this problem is note that W is the xy -plane of \mathbf{R}^3 , so the projection of $\begin{pmatrix} 0 \\ 2 \\ 4 \end{pmatrix}$ onto W is just $\begin{pmatrix} 0 \\ 2 \\ 0 \end{pmatrix}$.

- (4) One vector in W^\perp is $z = y - \text{proj}_W y = \begin{pmatrix} 0 \\ 2 \\ 4 \end{pmatrix} - \begin{pmatrix} 0 \\ 2 \\ 0 \end{pmatrix} = \begin{pmatrix} 0 \\ 0 \\ 4 \end{pmatrix}$.

- (5) Here is a picture. The vector w is labeled “ y_{hat} ” in the drawing.

5. Find the best fit line $y = Ax + B$ through the points $(0, 0)$, $(1, 8)$, $(3, 8)$, and $(4, 20)$.

Solution.

We want to find a least squares solution to the system of linear equations

$$\begin{aligned} 0 &= A(0) + B \\ 8 &= A(1) + B \\ 8 &= A(3) + B \\ 20 &= A(4) + B \end{aligned} \quad \iff \quad \begin{pmatrix} 0 & 1 \\ 1 & 1 \\ 3 & 1 \\ 4 & 1 \end{pmatrix} \begin{pmatrix} A \\ B \end{pmatrix} = \begin{pmatrix} 0 \\ 8 \\ 8 \\ 20 \end{pmatrix}.$$

We compute

$$\begin{pmatrix} 0 & 1 & 3 & 4 \\ 1 & 1 & 1 & 1 \end{pmatrix} \begin{pmatrix} 0 & 1 \\ 1 & 1 \\ 3 & 1 \\ 4 & 1 \end{pmatrix} = \begin{pmatrix} 26 & 8 \\ 8 & 4 \end{pmatrix}$$

$$\begin{pmatrix} 0 & 1 & 3 & 4 \\ 1 & 1 & 1 & 1 \end{pmatrix} \begin{pmatrix} 0 \\ 8 \\ 8 \\ 20 \end{pmatrix} = \begin{pmatrix} 112 \\ 36 \end{pmatrix}$$

$$\left(\begin{array}{cc|cc} 26 & 8 & 112 & \\ 8 & 4 & 36 & \end{array} \right) \xrightarrow{\text{rref}} \left(\begin{array}{cc|cc} 1 & 0 & 4 & \\ 0 & 1 & 1 & \end{array} \right).$$

Hence the least squares solution is $A = 4$ and $B = 1$, so the best fit line is $y = 4x + 1$.
